PYRAMYOTM

ADVENTURES IN RECREATION

CELEBRATE CROSMAN
100 YEARS

Dear All,

Pyramyd Air was founded by Josh Ungier in 1996. When I met Josh in late 1998 he needed an e-commerce enabled web site to sell bb guns online (namely the Anics 101 Air Pistol). It's a long story, but he really needed to start selling them to generate some cash.

Though, thinking back on it, the very first product Josh ever listed online for sale was the bolt action FX2000 PCP rifle.

When Josh got his 1st online order, he paged me to ask what the next steps are, because he did not feel it was right that he never spoke to the customer before charging the credit card. Not only was it endearing to hear; it was also a sign of core value - honesty; that's when I thought to myself, this is long term. 1st online order shipped on July 14, 1999, by the way...

Time went on, and the dream of selling BB guns was changing and taking a different shape.

Have you tried to find the right TV, or cell phone or coffee machine lately on Amazon or even Best Buy? Online or instore? Run into any issues? No idea how to choose the right product for you on those websites?

Where would you shop, and how would you trust that store to recommend you the right product? Reviews? Please... Amazon succeeded in ensuring that many customers don't necessarily trust their reviews.

We are going to address all of these issues, because they are real, and because they need addressing, and because that will change the world to be a better place.

It's a long path. Good things take time to build.

One of many first steps is - change how we come across to the outside world.

You probably already saw our new logo & colors! And yes, www.PyramydAir.com stays; but now A.I.R. gets a whole new meaning.

Pretty cool, eh? I think so, although I am biased...

The one thing you can be sure of - airguns are not going anywhere. They are in our DNA.

Val

THE BEST PELLET OF ALL

By Tom Gaylord

You have read online how one pellet is a lot more accurate than others, but then you see that in different airguns different pellets are best.

Why isn't there one pellet that's better than all the others?

I'll go farther than that. There is one brand of premium pellets that performs well in most airguns—and that is any pellet made by JSB.

However, before you mortgage your home to buy stock in that company, know that they are not always the best pellet. Yes, it's true. There are some airguns—even premium ones—that do not shoot JSB pellets well. What I'm saying is, it's never just this pellet or that one; you still have to check.

Pellet head size

So, what matters? And, is there any way to know for sure which pellet shoots the best? Perhaps not for absolute certainty, but there are things to look for. Let's start with head size. Through testing I have discovered that shooting pellets with consistent head sizes produces slightly better results than shooting with random sizes. Every pellet container will have

pellets with several different head sizes, even when the head size is written on the outside of the container. It takes many shots to see this—way more than the five or even ten shots we shoot for groups. You may see it in ten shots but you'll see it for certain if there are 50 shots at the same target. And the farther away you shoot the clearer this becomes. The difference is not usually that large, but it's there. On the other hand, individual pellet head sizes can also give dramatic results.

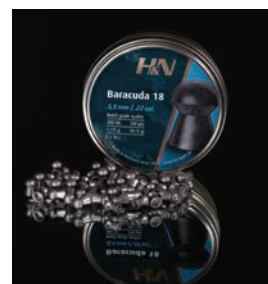

Some airguns that respond well to just one head size and no other. The differences in groups size in this instance can be 50 percent and even greater. Target airguns made for shooting at 10 meters will very often act this way. And usually the lower-powered sporting guns will also react dramatically when the head sizes are right or wrong. Powerful airguns seem to blast through this (head size) roadblock. But head sizes aren't everything.

Thin versus thick pellet skirts

I have found that in some lower-powered spring-piston airguns a thin pellet skirt makes a big difference for accuracy. I may get 40-50 percent smaller

groups when I use a pellet with a thin skirt. Examples of such pellets are, the RWS Superpoint and Superdome. At the other end of the skirt spectrum are pellets like H&N Baracudas. Their skirts are thick and may not fill the rifling as well as they must for accuracy.

Don't automatically rule them out though, because Baracudas often do very well in lower-powered airguns. It's all a matter of the bore size of the barrel, because smaller bores may grab the skirts of pellets with thicker skirts, just because they are a tight fit.

The fit of the pellet

To this point I have talked about how well a pellet fits the bore of an airgun barrel. A tight fit is usually the best, and that is where both the pellet head size and skirt thickness come into play. If the pellet fit is loose you can almost be assured it will not be accurate in that airgun. This is where breakbarrel spring-piston guns are so handy because you see how the pellet fits the bore every time you load the gun.

Pellet sizing?

It used to be popular 20-30 years ago to run each pellet through a die to squeeze it down to a consistent size. People thought that was key to accuracy. The small bit of testing I have done on this theory, plus the testing

of several others, has never produced any definitive proof that sizing pellets did anything. You see, the airgun barrel sizes the pellet quite effectively.

Hardness of the lead

After the size of the pellet, the hardness of the lead comes into play. While there are no pellets that are pure lead, many get close enough to call them that. Pure lead is soft and malleable, and it takes the rifling very well. Pure lead has a high degree of lubricity, which means that it is slippery inside the barrel. It tends not to smear off and remain on the interior walls of the bore until the velocity goes close to or over 900 f.p.s.

Some pellets are hardened by the inclusion of antimony in their alloy. That enables them to take the shape of the die that makes them quite well and they are especially resistant to deforming in the package. This is a desirable trait for pellets that will be fed through repeating mechanisms and semiautomatic mechanisms. Hard pellets can be very accurate in airguns when they fit the bores well. But hard lead does smear off and bond with the bore at lower velocities than the pure lead pellets with higher lubricity.

Bottom line

It almost seems like I tricked you when I say that the only real way to know whether a pellet is accurate in a certain airgun is to test it. The principles I have discussed in this article are guides to finding the best pellets for a certain airgun, but testing is the only way to be sure. For this reason, it is wise to buy pellet samplers that give you the opportunity to try different head sizes, pellet weights and more in one single package.

BUYING A CROSSBOW

Crossbows have a rich history and have reached the pinnacle of their evolution.

Modern **Technology**

Modern technology has made it easier to get a crossbow that works for you, whatever your use case or physical abilities. Choosing the right crossbow often depends on what you can physically handle and your personal preferences.

Target **Shooting**

If you're a target shooter, you can find a lightweight, super-fast crossbow that is easy to use and consistently hits the mark. On the other hand, if you're a hunter, you can find the perfect crossbow for whatever game you want to track. It all comes down to finding the one that suits your needs.

Recurve or **Compound**

The hardest part may be choosing between a recurve crossbow and a compound crossbow. They both have advantages and disadvantages. Recurves are strong and easy to maintain with simple mechanics. Compounds are easier to use, give you more options, and require more maintenance. The recurve's strength comes from the limbs, so they tend to have a heavier draw weight, while the compound has more of a mechanical advantage with its pulley system. Compound crossbows often have a variable draw weight so that they can be easily adjusted to the user's needs.

Choosing the Right **Draw Weight**

Speaking of draw weight, how do you choose the right one? While higher draw weights mean more power, you don't want to overdo it. If you can't draw it safely, it's not the right fit. Fortunately, you can add cocking aids to your crossbow, which allow archers of all strengths to handle powerful models. When you put the right equipment together with your passion, it's magic. So, weigh your priorities, gauge your strengths, and make the choice that helps you hit the bullseye - or your prey - with accuracy.
